To draw this molecule, use double and triple bonds:

Begin by drawing the basic skeleton of the molecule using only carbons and hydrogens.

Change one end of the bond to a nitrogen atom by selecting N from the element bar then selecting the atom.

To make a triple bond, select the Bonds submenu by clicking in the lower right corner of the Bond tool.

Select the triple bond, then select the bond to change.

You can change the bond to another kind of bond in the same way.
